Business Process Rescue

Operations Inbox

A lightweight enquiry-management workflow built to demonstrate business analysis, operational judgement, implementation and evidence-led reporting.

THE CHALLENGE

Small teams can lose visibility when enquiries move between email, spreadsheets and informal handovers. This project models a clear path from incoming request to ownership, due-date monitoring and management reporting.

SOLUTION

One queue for priorities, owners, status, due dates and an exportable summary.

EVIDENCE

11 domain tests and 12 scripted offline browser checks passed.

From workflow problem to working demonstration

01 Discovery & specification

Reviewed three UK advertisements covering product operations, implementation and performance improvement. Defined the user, a hypothetical as-is/to-be workflow and 11 acceptance criteria.

02 Implementation

Built a TypeScript operations dashboard with 18 synthetic enquiries, human-editable category and priority, owners, statuses, notes, deadline rules, search, filtering and CSV/Markdown exports.

03 Data quality & controls

Validated required CSV fields, email format, dates and duplicate IDs. Defined each KPI explicitly; overdue excludes resolved work. Suggested classifications remain overridable by staff.

04 Verification

Strict TypeScript checks and 11 automated domain tests passed. A scripted offline Chromium harness passed 12 interactions including updating cases, importing, exporting, filters, reset and mobile render.

05 Deployment evidence

Vercel confirms a production deployment in READY state with SSO disabled. Public HTTP smoke testing could not be performed in this environment, so it remains an open acceptance check.

06 Business outcome

A functional, documented workflow has been demonstrated. No real customer use, hours saved, service-level improvement or return on investment was measured.

DECISIONS THAT MATTER TO AN EMPLOYER

Translate ambiguous operational needs into a scoped workflow; design clear data rules; choose a low-maintenance stack; verify behaviour; explain what the evidence proves and what it does not.

Out of scope: live inboxes, real personal data, shared accounts and production SLAs.
